RAYNO testing guide

Step by step: real sign-in with SMS codes, and installing RAYNO on your team's phones in Sierra Leone. Everything works from any country: you can do Parts A and B from where you are now.

Part A	Part B	Part C
Set up the server	Build the Android app	Team installs it
You · laptop · 20 min	You · laptop · 30–60 min (mostly waiting)	Each tester · phone · 5 min

iPhone users in the team: Apple only allows testing through **TestFlight**, which needs the Apple Developer account (US$99/year). See Part D. Android users can start today, free.

Part A · Set up the server (Supabase)

Do this on your laptop. Supabase is the free online server that sends the codes and remembers the users.

1. **Get the newest app code.** On GitHub open **github.com/francisbendu/my-app** > green **Code** button > **Download ZIP** > right-click the ZIP > **Extract All** > **Extract**. Note the folder name (for example **my-app-main(3)**).
2. Open **supabase.com** > **Start your project** > sign up (use "Continue with GitHub", or your email).
3. Click **New project**:
   - Name: **RAYNO**
   - Database password: click **Generate**, then copy it into a safe place (you rarely need it, never share it).
   - Region: choose a European region (for example **West EU**). Click **Create new project** and wait about 2 minutes.
4. **Create the tables.** On your laptop open the app folder > **supabase** > right-click **schema.sql** > **Open with** > **Notepad**. Press **Ctrl + A**, then **Ctrl + C**.
   - In Supabase, left menu > **SQL Editor** > **New query** > click in the big box > **Ctrl + V** > **Run**.
   - You should see "Success. No rows returned".
5. **Turn on phone sign-in.** Left menu > **Authentication** > **Sign In / Providers** > **Phone** > switch on **Enable Phone provider**.
   - Under **Test phone numbers**, add one line per tester: number (country code, no + or spaces) = 6-digit code. Example:

```
23276000001=111111
23276000002=222222
23276000003=333333
```

   - Test numbers sign in with that code. No SMS is sent and nothing is charged. They do not even have to be real numbers.
   - If Supabase will not save without SMS provider details: pick **Twilio**, create a free trial at **twilio.com/try-twilio**, and copy its **Account SID**, **Auth Token** and **Messaging Service SID** into Supabase. (Real SMS later uses the same place.)
   - Click **Save**.
6. **Copy the two keys.** Left menu > **Project Settings** (gear) > **API Keys** (or **Data API**). Copy the **Project URL** and the **anon / public** key (or **publishable** key).

- **Never** copy or share the **service_role** / **secret** key.

7. **Put the keys in the app.** Open PowerShell in the new app folder (replace the folder name with yours):

```
cd "$HOME\Downloads\my-app-main(3)\my-app-main"
notepad .env
```

- Notepad asks "Do you want to create a new file?" > **Yes**. Type these two lines, with your own values, then **Ctrl + S** and close Notepad:

```
EXPO_PUBLIC_SUPABASE_URL=https://xxxxxxxx.supabase.co
EXPO_PUBLIC_SUPABASE_ANON_KEY=paste-the-anon-key-here
```

8. **Test it yourself first.** In PowerShell:

```
npm install
npx expo start --clear
```

- Open Expo Go on your phone > RAYNO > **Profile** > **Sign in with phone number** > type **76 000 001** > **Send code** > type **111111** > **Verify**.
- It should say "Signed in as +23276000001". In Supabase > **Authentication > Users** you will see the new user.

Part B · Build the Android app for the team

Expo builds a real Android app in the cloud and gives you a download link. Free account; the wait can be 10–60 minutes.

1. In the same PowerShell window (in the app folder), press **Ctrl + C** if the app is running, then sign in to Expo:

```
npx eas-cli@latest login
```

- Use your Expo account (**raynold_bendu** and the password you set).

2. Connect the project to your Expo account:

```
npx eas-cli@latest init
```

- If it asks "Would you like to create a project?" > press **Y** and Enter.

3. Start the Android build:

```
npx eas-cli@latest build --platform android --profile preview
```

- "Generate a new Android Keystore?" > **Y** (Expo keeps it safe for you).
- Wait. You can close the window: the build continues online. Progress is at **expo.dev** > your project > **Builds**.

4. When it finishes you get a **link** and a **QR code** (also on the build page: **Install** button). Copy the link.
5. Send the link to the team on WhatsApp together with their test number and code (Part C message below).

> **New features later:** after we change the app, run the build command again and send the new link. The .env file is included automatically, so sign-in keeps working.

Part C · Message to send to each Android tester

> Hi! Please help test our new app RAYNO.
> 1. Open this link on your Android phone: **[paste the link]**
> 2. Tap **Install** / **Download**, then open the downloaded file.
> 3. If your phone says installing is blocked, tap **Settings** > allow **Install unknown apps** for Chrome or WhatsApp > go back > **Install**.
> 4. Open RAYNO > **Profile** > **Sign in with phone number**.
> 5. Number: **[their test number, e.g. 76 000 002]** · Code: **[their code, e.g. 222222]**
> 6. Try everything: browse, search, open items, chat, add to cart, checkout (no real money). Send me screenshots of anything that looks wrong.

Part D · iPhone testers (TestFlight)

1. Enrol in the **Apple Developer Program** at **developer.apple.com/programs** (US$99/year). Approval can take 1–2 days; as a company you also need a free D-U-N-S number.
2. Then run, in the app folder:

```
npx eas-cli@latest build --platform ios --profile production
npx eas-cli@latest submit --platform ios
```

3. In **App Store Connect** > your app > **TestFlight**, invite testers by email (or a public link). They install Apple's free **TestFlight** app and open RAYNO from there.
4. Until then, iPhone users can only try RAYNO through Expo Go on the same Wi-Fi as your laptop.

Real SMS codes (later)

Test numbers are perfect for the team. For real users, connect an SMS provider in Supabase (Authentication > Phone): Twilio, Vonage or MessageBird. Each SMS to Sierra Leone costs about US$0.13–0.25. A Twilio trial can only text numbers you verify in Twilio first.

If you get stuck

Take a screenshot of the screen or the PowerShell window and send it to Claude. Never send the service_role / secret key or the database password.
